

A multi-touch capacitive touch screen infotainment saves my life

The multi-touch capacitive touch screen is used in all the smart phones, we are so used to the convenience it brings, but when it turns into a car stereo system, the convenience is gone!

Luck us, there are some companies who do care about our needs (of course for their own survival). Anyway, with this function all the dragging process becomes fun. Personally, I couldn't stop myself from organizing APPs into folders, and the scattered pieces of icons just drive me crazy, in this situation, a multiple touch capacitive touch screen really makes the whole work a lot easier.

One more thing hits my nerve in every driving because I need to use the Google map, but I like to zoom in to see the general direction I was about to go. My last car stereo didn't have the muti-touch function, and my fat finger just always missed the tiny little '-', now I don't even want to recall those dark memories.

My new car radio is Pumpkin's Android 8.0, no problem raised yet.
