- 20W in-dash car DVD player
- Support subwoofer audio output
- Support both 3C/480 connection
- Support steering wheel control function
- Support iPod/iPhone 4 audio input
- Support reversing camera

Language:

SD card:

Other than that, I put a 64 GB SD card in it with a ton of music and pictures on it and it read it as easy as if it were a 1 GB card. If you place the MP3's in folders (band/album) then you have the folder name come up on the head unit and you can quickly browse through and find any particular song you want. You can even get it to list all the songs on the card and have it play the whole thing, although I could never listen to everything there while in my car. I believe (not certain yet) that there's a randomize or shuffle function, but I haven't had the time to try that yet. They state it will only access a 32 GB card, but I'm getting the full 64GB's I have in it. Maybe it has something to do with the type of card you're using? I bought one specifically for cameras and its read/write speeds (very fast) and it accesses the whole thing !

Bluetooth:

Bluetooth on this is seamless and works like a charm. Set it for the phone and as soon as the unit turns on again... bingo – it automatically connects if you've set it up for automatic connection.

Mic:

The internal mic is clear enough that other people can hear me and I have it set to auto answer incoming calls so I do not have to take my eyes off the road to get the phone to answer. Safety is the main concern. I value that over screening my calls while driving. The contacts list imported easily and calls made out are fine. I now need to incorporate voice commands to it and then try to find a text to speech app for texting... if that can even be done on this unit.

I easily would recommend this to friends and family without hesitation.

UPDATE:

This head unit is a tank. They sent me the KitKat update. I followed the instructions and it went through without a hitch. My buddy just bought a high dollar Pioneer and it can't do 1/4 of the stuff this one does. Do yourself a favor... if you're looking for a good android head unit, then you're in the right place. The people behind it, while a little poor with the english language – not so bad that I can't understand them – are quick to respond, very helpful and will answer any question you can throw at them. I would not hesitate to buy another head unit from them again.
